**Title: Metastasis and Invasion in Melanoma**

---

---

**Proposal**

Melanoma is one of most deadly malignancy in the world and the most significant characteristic of melanoma is developing early metastasis. The patients with metastatic melanoma have a poor prognosis, with a 5-year survival rate less than 10%. Melanoma can easily disseminate from primary site and metastasize to multiple sites including the lung, liver, brain, bone, and lymph nodes. Investigating changes of molecules and signaling transduction pathway during metastatic procedure leads to understand the mechanism of metastasis in melanoma.

We encourage authors to submit original manuscripts providing insights into the causes and progression of melanoma metastasis and invasion. Before submission authors should carefully read over the journal's Author Guidelines, which are located at <http://www.lifescienceglobal.com/publish-with-us/guidelines-for-authors>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://www.lifescienceglobal.com/pms/index.php/jcru> according to the following timetable:
